Abstract

This paper proposes a simple periodic ETF sector rotation strategy for S&P-500. Unlike most ETF rotation strategies, the proposed strategy does not predict economic cycles. The strategy involves periodic ranking of component sectors based on sector ETF returns and reinvesting funds equally into the middle ("median") three sector ETFs. We show that for the S&P-500, the proposed "median" ETF rotation strategy with monthly rebalancing is better than focusing on the "winners" or the "losers" sector ETFs with different frequencies of re-balancing. Using historical data from 2000, we show that the proposed "median" monthly rotation strategy significantly outperforms the other two strategies and passive index investment in terms of total return, volatility, and maximum drawdown. An average investor can easily implement the proposed ETF rotation strategy.

Keywords: sector rotation, portfolio construction, median sector strategy

1 Introduction

A sector rotation strategy involves allocating money to sectors predicted to outperform in the next investment period [1, 2, 3, 4]. Different sectors perform differently in different economic cycles. For instance, cyclical sectors like Consumer Discretionary, Financials, and Materials perform well during phases of economic expansions, whereas defensive sectors such as Consumer Staples, Utilities, and Healthcare perform better during economic downturns. Such strategies are often implemented with exchange-traded funds (ETFs) [5]

Accurate prediction of economic cycles could provide significant outperformance [6, 7, 8]. It is not surprising that many strategies have been proposed including business-cycle prediction [9, 10, 11], Momentum–Driven and Mean Reversion [12, 13, 14, 15], PCA-based methods [16], interest-rate based ([16, 17, 18, 19, 20, 21, 22, 23], to name just some). However, such a prediction is difficult. A recent detailed analysis of sector rotation strategies in [24] indicates that most such strategies cannot consistently generate excess returns.

In a recent paper [25], the authors suggested a simple rotation strategy where one ranks (by returns) the nine ETF sector funds and invest equally in the middle 3 ETFs. it was shown that such a "median" strategy outperforms S&P-500 passive investment with the best results at monthly frequency. Such median strategy was also suggested in a recent paper [26] where the authors

suggested a periodic investment in the middle performing 10 stocks in the Dow Jones Industrial Average.

But what about always investing in the best 3 ETFs ("winners") or worst 3 ETFs ("losers). When are such strategies profitable? How do they compare with the "median" rotation? We address these questions in this paper. We show that the answer to the above questions depends on the frequency of re-balancing. If re-balancing is done annually, "winners", "median" and "loser" strategies outperform passive index investing. For annual rebalancing, investing in the "Losers" rotation strategy gives the best total return (with higher volatility and drawdowns). If re-balancing is done weekly, then investing in "winners" rotation strategy outperforms all other strategies (including passive index investing) and gives the highest total return (with higher volatility and maximum drawdown). By contrast, the "median" rotation strategy outperforms all other strategies by total return, volatility, and drawdown when re-balancing is done monthly. Its outperformance over passive S&P-500 investing is significant: almost double the total return with lower volatility. As a result, the median rotation strategy is the best choice offsetting transaction costs and possible tax considerations.

The proposed median rotation strategy is purely "mechanical" and requires no specialized skills. It can be easily implemented by any self-directed investor.

2 "Winner", "Median" and "Loser" Strategies

For our rotation strategies, we consider the following nine S&P-500 industry sectors with the corresponding Select Sector SPDR Exhange Traded Funds[27]

- 1. XLB (Materials)
- 2. **XLE** (Energy)
- 3. **XLF** (Financials)
- 4. **XLI** (Industrials)
- 5. **XLK** (Technology)
- 6. **XLP** (Consumer Staples)
- 7. **XLU** (Utilities)
- 8. **XLV** (Healthcare)
- 9. **XLY** (Consumer Discretionary)

There are currently 11 such ETFs. The above list does not include the following two ETFs:

- 1. **XLC** (Communication Services) created in June 2018
- 2. XLRE (Real Estate) created created in October 2015

These two ETFs were created at a much later date and will not be considered. By contrast, the other nine ETFs were created in 1998.

We define the following three ETF rotation strategies:

- "Winners" (W)- always (re)invest in the three ETFs with the "best" performance in the previous time period
- "Median" (M) always invest in the middle three ETFs with the "median" performance in the previous time period
- "Losers" (L) always invest in the three ETFs with the "worst" performance in the previous time period

The argument for the "winners" strategy is "trend momentum" or "keep the winners" argument: a belief that the momentum of these ETFs will continue in the next period. The argument for the

"losers" strategy or "buy losers" is "trend reversal" - a belief that these ETFs are oversold and that investors will switch to buying these "beaten-down" sectors. By contrast, the argument for the "median" performers is capture sectors that may not be the top performers but demonstrate consistent and stable returns. By focusing on median-performing sectors, the strategy aims to reduce exposure to highly volatile or underperforming sectors, thus potentially lowering risk while still capturing reasonable upside potential. We will show in this paper that this strategy can significantly outperform the "winners" and "losers" strategy as well as passive "Buy and Hold" (B&H) strategy with monthly rotation frequency.

Let us consider the following example to illustrate these strategies. Suppose that we re-balance annually, starting in 2000. We want to identify what ETFs should be included for investing in each strategy. To that end, we compute the annual returns of our nine ETFs starting in 1999 (the previous time period). These annual returns are given for all ETFs for 1999-2024 in Table 3 in the Appendix A. The annual returns for 1999 from Table 3 are:

$$XLB = 23.0\%$$
, $XLE = 18.0\%$, $XLF = 2.6\%$, $XLI = 21.8\%$, $XLK = 65.1\%$
 $XLP = -14.2\%$, $XLU = -4.4\%$, $XLV = 19.5\%$, $XLY = 19.5\%$

Once we have the returns, we rank our nine ETFs by return and split them into three groups: Winners, Median, and Losers.

$$\underbrace{\mathbf{XLK} > \mathbf{XLB} > \mathbf{XLI}}_{\text{Winners}} > \underbrace{\mathbf{XLV} > \mathbf{XLY} > \mathbf{XLE}}_{\text{Median}} > \underbrace{\mathbf{XLF} > \mathbf{XLU} > \mathbf{XLP}}_{\text{Losers}}$$

Therefore, for 2000 our choices for the strategies are:

- "Winners": XLB, XLI, and XLK (Basic Materials, Industrials, and Technology)
- "Median": XLE, XLV, and XLY (Energy, Healthcare, and Consumer Discretionary)
- "Losers": XLF, XLP, and XLU (Financials, Consumer Staples, and Utilities)

In each strategy, we invest all the money from the previous investment period and invest 1/3 of the money in each of the three ETFs. In these strategies, we use returns as a performance metric. We could use other metrics such as risk-adjusted returns but these are more difficult to compete for an average investor. We note that in all of these strategies, we reinvest the same amount for each fund, regardless of the corresponding sector weights in the S&P-500 index. For example, the technology index XLK was 17% of the index in 2003, 11% in 2013, and 23% in 2023. The above strategies ignore these weights and allocate the money equally among the three sectors chosen for investment in the next investment period.

We note that with a higher frequency of rotation, we have more trades. In the worst case, we need to execute 6 transactions (sell 3 ETFs and invest in 3 different ETFs) at the end of each investment period. There are also short-term tax implications of more frequent trading. Therefore, the proposed strategy has to generate enough out-performance to make it attractive even for non tax-deferred accounts. We will demonstrate that the 'Median' monthly rotation strategy significantly outperforms other strategies, including the passive index investing, even after taking transaction costs and taxes into account.

To evaluate the effectiveness of the above strategies, we will use historical data from 1999 to 2024 to compare strategies to each other and to to the buy-and-hold (B&H) strategy for each of the 25 years. The buy-and-hold strategy can be easily implemented by investing in the "SPY" exchange-traded fund. We will evaluate the performance of the strategies over different rotation periods (weekly, monthly, quarterly, semi-annually, and annually) and provide detailed comparisons in terms of growth, returns, volatility, Sharpe's ratios, and drawdowns. Based on these comparisons,

the best strategy is the "Median" strategy with monthly rotation. This strategy seeks to capitalize on both mean reversion and momentum effects within the market. The strategy provides a balanced approach to sector rotation that mitigates the extremes and leverages the median performance. Just as in statistics, the use of the median provides a more accurate representation of central tendencies, offering a balanced view of sector performance not influenced by outliers.

This method is designed to be both straightforward in implementation and highly accessible to individual investors.

3 Results and Discussion

We start by comparing the total growth for these strategies for different re-balancing periods We consider 5 different re-balancing frequencies with corresponding periods: annual (12 months), semi-annual (6 months), quarterly (3 months), monthly (1 month) and weekly (1 week). For each rotation frequency, we examine the returns at the end of each investment period, sort ETFs by returns, and identify which ETFs will be used in the strategy for the next investment period.

The detailed annual results, including growth, returns, volatility (risk), Sharpe's ratio and Maximum Drawdowns (MDD) for each frequency are presented in Appendix C. In Table 1 we summarize the final balances yielded by each strategy at the end of 2024 after 25 years. We assume that we start with \$100 at the end of 1999.

| _ | | _ | | | _ |
|------------|--------|-------------|-----------|---------|--------|
| Stratogy | | ROTATIO | N FREQUE | ENCY | |
| Strategy | Annual | Semi-Annual | Quarterly | Monthly | weekly |
| Winners | 511 | 862 | 644 | 469 | 427 |
| Median | 696 | 584 | 737 | 1,434 | 792 |
| Losers | 1,013 | 737 | 768 | 529 | 1,104 |
| Buy & Hold | | | 626 | | |

Table 1: Comparison of Strategies Final Balances for Different Rotation Frequecies

From this table, we see that the performance of strategies differs significantly depending on the re-balancing frequency. This is further illustrated in Figure 1. The "Winners" outperform B&H at lower re-balancing frequency with the best result with semi-annual rotation. However, it underperforms B&H at weekly, monthly and annual re-balancing frequencies and is practically identical at quarterly frequency. "Losers" strategy does better with annual and weekly rotation. However, at most frequencies, it results in significantly higher drawdowns as shown in Figure 2. The "Losers" strategy underperforms B&H in terms of growth at Monthly rotation frequency. The "median" rotation strategy with monthly re-balancing is clearly the top winner in terms of overall growth and drawdowns, delivering more than twice the growth of passive Buy&Hold (B&H) strategy with about 50% lower maximum drawdowns. Additional details on the performance of this strategy are provided in Appendix D.

From these Figures we make the following observations:

• Total growth and Rotation Frequency: the monthly investment frequency stands out as the top performer using the "Median" strategy. The outperformance of the median strategy compared to "Buy-and-Hold" is very significant: more than 100% (\$1,434 vs. \$626). This makes the strategy attractive even in non-tax deferred accounts. The top contender is the "Losers" strategy with weekly rotation strategy. However, this us significantly lower (\$1,013 vs. \$1,434) than median and comes with significantly higher volatility, drawdowns and number

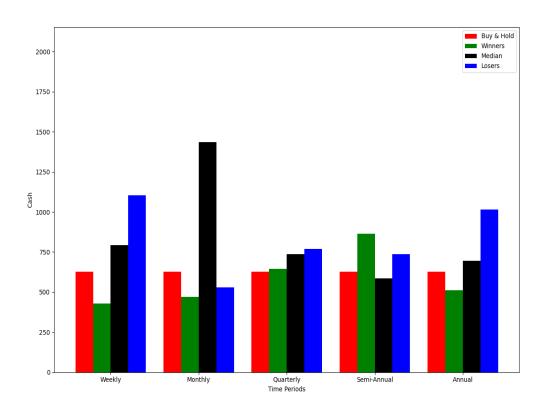

Figure 1: Comparing cash across various strategies and frequencies

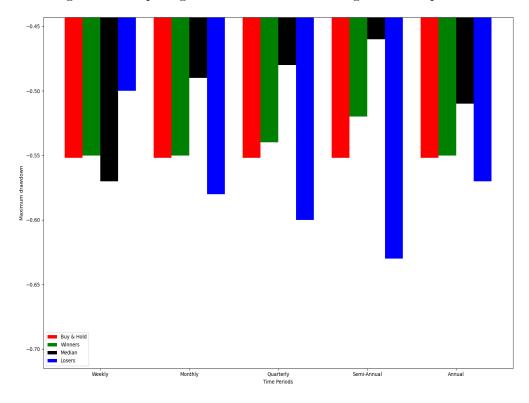

Figure 2: Comparing drawdown across various strategies and frequencies

of trades. For the monthly re-balancing, the growth by each strategy as shown in Figure 3 and additional detailed tables are given in Appendix D.

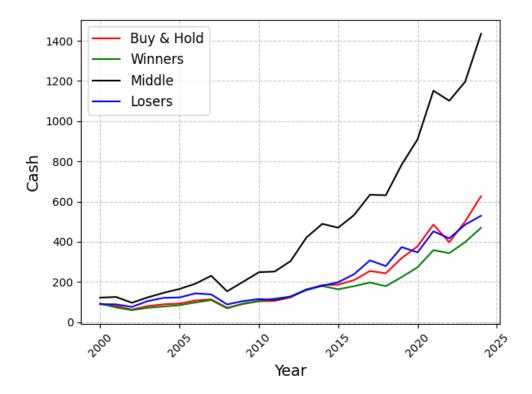

Figure 3: Comparison of Growth for Strategies with Monthly Re-balancing

What about other rotation frequencies and strategies? Consider the "Losers" strategy. For the weekly re-balancing, it clearly outperforms all other strategies. However, for weekly re-balancing, its maximum drawdown is almost twice as that of the "median" or "B&H" strategies. Interestingly, the "winners" strategy has the lowest drawdown with weekly rotation. One plausible explanation is that their ETFs growth has some inertia before investors take profits from the winning sectors and re-allocate their funds.that in the Median groups. Interestingly, "Losers" strategy performs particularly well if annual rotation is considered, delivering more than 30% more growth compared to the other strategies while exhhibiting similar drawdowns.

• Annualized Returns: If we examine the summary statistics for Annualized returns for different frequencie, we see that except for weekly rotation frequencies, the "Median" strategy has the lowest variability if annualized returns, delivering more stable and consistent growth compared with the other strategies. Consider the performance of the "median" strategy with monthly rotation during the market downturns in the 2001 Internet "bubble" and the 2008 financial meltdown shown in Table 11 in Appendix C. In 2001, the Median group achieved an annualized return of 1.2%, defying the broader trend, as the overall market represented by the Buy & Hold declined by – 11.8% and the growth of "Winners" strategy was –21.6%. This performance suggests that during periods of economic uncertainty, a more conservative strategy focusing on stable performers can provide better performance. Fast forward to 2008, a year synonymous with the financial crisis, the Median group's performance plummeted to

-33.5%. However, this was still better than the losses suffered by other strategies (-37.5% for "Winners", -36.2% for "losers" and -36.9% for Buy&Hold strategy).

- Volatility: Volatility serves as a critical metric for understanding the risk associated with various investment strategies. For Median group, volatility levels were moderate compared to other groups. Except for the quarterly re-balancing, the "Median" strategy has lower average annual volatility and lower standard deviation of these annual risk metrics. At all rotation frequencies, the "median" rotation provides lower volatility than Buy&Hold strategy. It consistently displayed a more balanced risk profile, particularly during periods of market instability.
- Sharpe Ratio: The Sharpe ratio, which measures risk adjusted returns, was highest for the "Median" strategy with monthly re-balancing in 11 years out of 25 compared with 3 years for the "Winners" and 7 years for the "Losers" strategy. This is shown in Table 16 in Appendix D.
- Maximum Drawdown: The Median group and Winners had similar MDD with monthy re-balancing and outperformed both B&H and the "Losers" strategy. This is illustrated in Table 16 in Appendix D.
- Summary: The best strategy is the "median" with monthly rotation frequency

Finally, it is interesting to compare the results of the strategies with B&H strategies applied to individual ETFs. The results are summarized in Table 2. The highest growth is provided by **XLY**

Table 2: Comparison of Total Growth (2000-2024)

| S&P | XLB | XLE | XLF | XLI | XLK | XLP | XLU | XLV | XLY |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 626 | 555 | 606 | 411 | 698 | 575 | 618 | 646 | 645 | 965 |

(Consumer Discretionary) and the lowest by **XLF** (Financials). The results for **XLK** (Technology) are similar to that of **XLB** (Basic Materials). These results may seem counter-intuitive but we need to remember that although for many years technology and financial stocks may outperform sectors, they have much steeper losses and drawdowns. For example, financial sector **XLF** lost more than 50% of its value during the financial crisis of 2008-2009 compared with about 32% for **XLY**. Over the 25 years, the performance of the **XLY** echange-traded fund signifantly outperforms the **XLF** fund.

4 Conclusion

The results illustrate that the Median strategy, characterized by a focus on average performers rather than chasing extremes, can offer a prudent approach in managing risk while still capturing market opportunities. During challenging times, the Median group proved to be more resilient compared to the extremes of Winners and Losers. By emphasizing stability, the Median strategy not only shields investors from harsher impacts of market volatility but also positions them from favorable for recovery in the upswing of market cycles.
